

# Why SSL Encrypted Traffic Management from Symantec Leads the Way

|             | Symantec  | Typical Next Generation Firewall (NGFW) | Typical Application Delivery Controller / Load Balancer | Typical Traffic Monitoring & Management |
|-------------|---|---|---|---|
| RELIABILITY | <b>Enterprise-class Reliability and Simplicity</b>  |   |   |   |
|             | Purpose-built device for SSL/TLS decryption and re-encryption   | ✓                                       | —   | ✓                                       |
|             | Easy-to-use solution without complex scripting or synchronization – yields faster time-to-productivity                          | ✓                                       | —   | ✓                                       |
|             | Not a targeted, vulnerable device – lacks an IP address on network ports  | ✓                                       | —   | ✓                                       |
| PERFORMANCE | <b>Performance and Scalability</b>  |   |   |   |
|             | Feeds multiple active and passive security devices simultaneously with a decrypted traffic stream without impacting performance | ✓                                       | —   | ✓                                       |
|             | Top throughput capacity requires no costly performance upgrades   | ✓                                       | ✓   | —                                       |
|             | Supports multiple network segments and multiple devices per segment in a single appliance                                       | ✓                                       | —   | ✓                                       |
| POLICIES    | <b>Policy Features and Enforcement</b>  |   |   |   |
|             | Supports comprehensive policies based on SSL/TLS traffic categories   | ✓                                       | —   | ✓                                       |
|             | Threat categorization leader with cloud-based Global Intelligence of SSL websites and malnets                                   | ✓                                       | —   | —                                       |
|             | Automatically detects and prevents TLS vulnerabilities like Heartbleed  | ✓                                       | —   | —                                       |
|             | Can identify, log and block outdated or weak ciphers (e.g. SSL v3.0, RSA key exchange)  | ✓                                       | —   | —                                       |
| MANAGEMENT  | <b>Management, Deployment and Interoperability</b>  |   |   |   |
|             | Protocol and port agnostic – automatic, complete visibility into all traffic running over SSL                                   | ✓                                       | —   | —                                       |
|             | Highly granular SSL and session logging for actionable intelligence   | ✓                                       | ✓   | —                                       |
|             | Cipher Key and Management support   | ✓                                       | ✓   | ✓                                       |
|             | Comprehensive support of ALL advanced new ciphers (i.e. AES-GCM, Camellia, ChaCha20, DHE and ECDHE)                             | ✓                                       | —   | —                                       |
|             | Simple, unobtrusive deployment without re-architecting the network infrastructure   | ✓                                       | ✓   | —                                       |
|             | Ease of deployment in existing network topologies   | ✓                                       | —   | —                                       |
